

BGP Configuration for a Transit ISP

ISP Workshops

Definitions

- **Transit** – carrying traffic across a network, usually for a fee
traffic and prefixes originating from one AS are carried across an intermediate AS to reach their destination AS
- **Peering** – private interconnect between two ASNs, usually for no fee
- **Internet Exchange Point** – common interconnect location where several ASNs exchange routing information and traffic

ISP Transit Issues

- Only announce default to your BGP customers unless they need more prefixes
- Only accept the prefixes which your customer is entitled to originate
- If your customer hasn't told you he is providing transit to his BGP customers, don't accept anything else he may announce

ISP Transit Issues

Many mistakes are made on the Internet today due to incomplete understanding of how to configure BGP for transit

ISP Transit Provider

Simple Example

ISP Transit

- AS120 is transit provider between AS130 and AS100
- AS130 and AS100 are stub/customer ASes of AS120
 - They may have their own peerings with other ASes
 - Minimal routing table desired
 - Minimum complexity required

AS130 Customer

■ Router A Configuration

```
router bgp 130
  network 121.10.0.0 mask 255.255.224.0
  neighbor 122.12.10.2 remote-as 120
  neighbor 122.12.10.2 prefix-list upstream out
  neighbor 122.12.10.2 prefix-list default in
  !
  ip prefix-list default permit 0.0.0.0/0
  ip prefix-list upstream permit 121.10.0.0/19
  !
  ip route 121.10.0.0 255.255.224.0 null0
```

AS120 Transit Provider

■ Router B Configuration

```
router bgp 120
  neighbor 122.12.10.1 remote-as 130
  neighbor 122.12.10.1 default-originate
  neighbor 122.12.10.1 prefix-list Customer130 in
  neighbor 122.12.10.1 prefix-list default out
!
ip prefix-list Customer130 permit 121.10.0.0/19
ip prefix-list default permit 0.0.0.0/0
```

- Router B announces default to Router A, only accepts customer /19

AS120 Transit Provider

■ Router C Configuration

```
router bgp 120
  neighbor 122.12.20.1 remote-as 100
  neighbor 122.12.20.1 default-originate
  neighbor 122.12.20.1 prefix-list Customer100 in
  neighbor 122.12.20.1 prefix-list default out
!
ip prefix-list Customer100 permit 109.0.0.0/19
ip prefix-list default permit 0.0.0.0/0
```

- Router C announces default to Router D, only accepts customer /19

AS100 Customer

■ Router D Configuration

```
router bgp 100
  network 109.0.0.0 mask 255.255.224.0
  neighbor 122.12.20.2 remote-as 120
  neighbor 122.12.20.2 prefix-list upstream out
  neighbor 122.12.20.2 prefix-list default in
  !
  ip prefix-list default permit 0.0.0.0/0
  ip prefix-list upstream permit 109.0.0.0/19
  !
  ip route 109.0.0.0 255.255.224.0 null0
```

ISP Transit

- This is simple case:

if AS130 or AS100 get another address block, they have to change their prefix filters and ask AS120 to do the same

Some ISP transit providers are better skilled at doing this than others!

May not scale if they are frequently adding new prefixes

The Internet Routing Registry is an alternative mechanism allowing semi-automation of this activity

ISP Transit Provider

More complex Example 1

ISP Transit

- AS130 and AS100 are stub/customer ASes of AS120
- AS120:
 - Provides transit between AS130 and AS100
 - Does not provide full Internet access to AS130
 - Provides full Internet access for AS100

ISP Transit

- AS120 is transit provider between AS130 and AS100

AS130 Customer

■ Router A Configuration

```
router bgp 130
  network 121.10.0.0 mask 255.255.224.0
  neighbor 122.12.10.2 remote-as 120
  neighbor 122.12.10.2 prefix-list as130-prefixes out
  neighbor 122.12.10.2 prefix-list bogons in
  !
  ip prefix-list as130-prefixes permit 121.10.0.0/19
  !
  ! The bogons prefix list contains prefixes which
  ! should not appear in the Internet Routing System
  !
  ip route 121.10.0.0 255.255.224.0 null0
```

AS120 Transit Provider

■ Router B Configuration

```
router bgp 120
  neighbor 122.12.10.1 remote-as 130
  neighbor 122.12.10.1 prefix-list as130-cust in
  neighbor 122.12.10.1 prefix-list bogons out
  neighbor 122.12.10.1 filter-list 15 out
!
ip as-path access-list 15 permit ^$
ip as-path access-list 15 permit ^100$
ip prefix-list as130-cust permit 121.10.0.0/19
```

- Router B announces AS120 and AS100 prefixes to Router A, only accepts customer /19

AS120 Transit Provider

- Router C Configuration

```
router bgp 120
  neighbor 122.12.20.1 remote-as 100
  neighbor 122.12.20.1 default-originate
  neighbor 122.12.20.1 prefix-list as100-cust in
  neighbor 122.12.20.1 prefix-list default out
!
ip prefix-list as100-cust permit 109.0.0.0/19
ip prefix-list default permit 0.0.0.0/0
```

- Router C announces default to Router D, only accepts customer /19

AS100 Customer

■ Router D Configuration

```
router bgp 100
  network 109.0.0.0 mask 255.255.224.0
  neighbor 122.12.20.2 remote-as 120
  neighbor 122.12.20.2 prefix-list as100-prefix out
  neighbor 122.12.20.2 prefix-list default in
  !
ip prefix-list default permit 0.0.0.0/0
ip prefix-list as100-prefix permit 109.0.0.0/19
  !
ip route 109.0.0.0 255.255.224.0 null0
```

ISP Transit

- AS130 only hears AS120 and AS100 prefixes
 - Inbound AS path filter on Router A is optional, but good practice (never trust a peer)
 - Inbound bogon prefix-list filters are considered mandatory on all Internet peerings
 - See the next transit example for a typical bogon list
 - (Consult BGP BCP presentation for more information on BGP best practices)

ISP Transit Provider

More complex Example 2

ISP Transit

- AS130 has several customer ASes connecting to its backbone
- AS130 and AS100 are stub/customer ASes of AS120
 - AS130 has many customers with their own ASes
 - AS105 doesn't get announced to AS120
 - AS120 provides transit between AS130 and AS100

AS130 Customer

■ Router A Configuration

```
router bgp 130
  network 121.10.0.0 mask 255.255.224.0
  neighbor 122.12.10.2 remote-as 120
  neighbor 122.12.10.2 prefix-list upstream-out out
  neighbor 122.12.10.2 filter-list 5 out
  neighbor 122.12.10.2 prefix-list upstream-in in
  !
ip route 121.10.0.0 255.255.224.0 null0 250
  !
..next slide
```

AS130 Customer

!

! AS-path filters...

```
ip as-path access-list 5 permit ^$
```

```
ip as-path access-list 5 permit ^(101_)+$
```

```
ip as-path access-list 5 permit ^102$
```

```
ip as-path access-list 5 permit ^103$
```

```
ip as-path access-list 5 permit ^104$
```

```
ip as-path access-list 5 deny ^105_
```

!

..next slide

AS130 Customer

! Outbound Bogon prefixes to be blocked to eBGP peers

```
ip prefix-list upstream-out deny 0.0.0.0/8 le 32
```

```
ip prefix-list upstream-out deny 10.0.0.0/8 le 32
```

```
ip prefix-list upstream-out deny 127.0.0.0/8 le 32
```

```
ip prefix-list upstream-out deny 169.254.0.0/16 le 32
```

```
ip prefix-list upstream-out deny 172.16.0.0/12 le 32
```

```
ip prefix-list upstream-out deny 192.0.2.0/24 le 32
```

```
ip prefix-list upstream-out deny 192.168.0.0/16 le 32
```

```
ip prefix-list upstream-out deny 224.0.0.0/3 le 32
```

```
ip prefix-list upstream-out deny 0.0.0.0/0 ge 25
```

! Extra prefixes

```
ip prefix-list upstream-out deny 121.10.0.0/19 ge 20
```

```
ip prefix-list upstream-out permit 0.0.0.0/0 le 32
```

..next slide

AS130 Customer

! Inbound Bogon prefixes to be blocked from eBGP peers

```
ip prefix-list upstream-in deny 0.0.0.0/8 le 32
```

```
ip prefix-list upstream-in deny 10.0.0.0/8 le 32
```

```
ip prefix-list upstream-in deny 127.0.0.0/8 le 32
```

```
ip prefix-list upstream-in deny 169.254.0.0/16 le 32
```

```
ip prefix-list upstream-in deny 172.16.0.0/12 le 32
```

```
ip prefix-list upstream-in deny 192.0.2.0/24 le 32
```

```
ip prefix-list upstream-in deny 192.168.0.0/16 le 32
```

```
ip prefix-list upstream-in deny 224.0.0.0/3 le 32
```

```
ip prefix-list upstream-in deny 0.0.0.0/0 ge 25
```

! Extra prefixes

```
ip prefix-list upstream-in deny 121.10.0.0/19 le 32
```

```
ip prefix-list upstream-in permit 0.0.0.0/0 le 32
```

!

AS120 Transit Provider

- Router B Configuration

```
router bgp 120
  neighbor 122.12.10.1 remote-as 130
  neighbor 122.12.10.1 prefix-list bogons in
  neighbor 122.12.10.1 prefix-list bogons out
  neighbor 122.12.10.1 filter-list 10 in
  neighbor 122.12.10.1 filter-list 15 out
!
ip as-path access-list 15 permit ^$
ip as-path access-list 15 permit ^100$
ip as-path access-list 10 permit ^[0-9]+_[0-9]+$
```

- Router B announces AS120 and AS100 prefixes to Router A, and accepts all AS130 customer ASes

AS120 Transit Provider

■ Router C Configuration

```
router bgp 120
  neighbor 122.12.20.1 remote-as 100
  neighbor 122.12.20.1 default-originate
  neighbor 122.12.20.1 prefix-list Customer100 in
  neighbor 122.12.20.1 prefix-list default out
!
ip prefix-list Customer100 permit 109.0.0.0/19
ip prefix-list default permit 0.0.0.0/0
```

- Router C announces default to Router D, only accepts customer /19

AS100 Customer

■ Router D Configuration

```
router bgp 100
  network 109.0.0.0 mask 255.255.224.0
  neighbor 122.12.20.2 remote-as 120
  neighbor 122.12.20.2 prefix-list upstream out
  neighbor 122.12.20.2 prefix-list default in
  !
  ip prefix-list default permit 0.0.0.0/0
  ip prefix-list upstream permit 109.0.0.0/19
  !
  ip route 109.0.0.0 255.255.224.0 null0
```

ISP Transit

- AS130 only hears AS120 and AS100 prefixes
 - inbound AS path filter on Router A is optional, but good practice (never trust a peer)
 - Special Use Address prefix-list filters are required on all Internet peerings
- This situation is getting more complex, and you can see the BGP configuration could easily get out of hand
 - Solution: BGP Communities

ISP Transit Provider

More complex Example 3

ISP Transit

- AS130 and AS100 are stub/customer ASes of AS120
 - AS130 has many customers with their own ASes
 - AS105 doesn't get announced to AS120
 - AS120 provides transit between AS130 and AS100
- Same example as previously but using communities

ISP Transit

- AS130 has several customer ASes connecting to its backbone
- AS130 and AS100 are stub/customer ASes of AS120
 - AS130 has many customers with their own ASes
 - AS105 doesn't get announced to AS120
 - AS120 provides transit between AS130 and AS100
- Same example as previously but using communities

AS130 Customer

- Router A configuration is greatly simplified
 - All prefixes to be announced to upstream are marked with Community 130:5100
 - Route-map on outbound peering implements community policy
 - Bogon prefix-lists still required

AS130 Customer

■ Router A Configuration

```
router bgp 130
  network 121.10.0.0 mask 255.255.224.0 route-map setcomm
  neighbor 122.12.10.2 remote-as 120
  neighbor 122.12.10.2 prefix-list upstream-out out
  neighbor 122.12.10.2 route-map to-AS120 out
  neighbor 122.12.10.2 prefix-list upstream-in in
  !
ip route 121.10.0.0 255.255.224.0 null0 250
  !
..next slide
```

AS130 Customer

```
!  
ip community-list 5 permit 130:5100  
!  
! Set community on local prefixes  
route-map setcomm permit 10  
  set community 130:5100  
!  
route-map to-AS120 permit 10  
  match community 5  
!
```

- upstream-in and upstream-out prefix-lists are the same as in the previous example - they simply deny bogon prefixes and allow everything else

AS130 Customer

■ Router E Configuration

```
router bgp 130
```

```
neighbor x.x.x.x remote-as 101
```

```
neighbor x.x.x.x default-originate
```

```
neighbor x.x.x.x prefix-list customer101 in
```

```
neighbor x.x.x.x route-map bgp-cust-in in
```

```
neighbor x.x.x.x prefix-list default out
```

```
neighbor x.x.x.x remote-as 102
```

```
neighbor x.x.x.x default-originate
```

```
neighbor x.x.x.x prefix-list customer102 in
```

```
neighbor x.x.x.x route-map bgp-cust-in in
```

```
neighbor x.x.x.x prefix-list default out
```

..next slide

AS130 Customer

```
neighbor s.s.s.s remote-as 105
neighbor s.s.s.s default-originate
neighbor s.s.s.s prefix-list customer105 in
neighbor s.s.s.s route-map no-transit in
neighbor s.s.s.s prefix-list default out
!
! Set community on eBGP customers announced to AS120
route-map bgp-cust-in permit 10
  set community 130:5100
route-map no-transit permit 10
  set community 130:5199
```

- Notice that AS105 peering is put into a different community - one that is not announced to AS130's upstream

ISP Transit

- AS130 only announces the community 130:5100 to AS120
- Notice how Router E tags the prefixes to be announced to AS120 with community 130:5100
- More efficient to manage than using filter lists

Summary

Summary

- Being a transit provider is simply a case of working out a scalable filtering policy
 - Default or full routes to a customer
 - Accept only customer prefixes
 - Use communities for scaling

BGP Configuration for a Transit ISP

ISP Workshops
